

SIEMPELKAMP

Siempelkamp says it is once again seizing the opportunity this year to present innovations for reducing costs and saving energy in wood based panel production to an international industry audience.

The Ecodrive drive system is designed to power the ContiRoll press line's discharge drums. Consisting of an energy-efficient electric motor and two-stage gearbox, the powerful system is suitable for all ContiRoll models, past and present.

In addition to this new drive technology; glue blending and metering systems; mat formers like the ecoformer SL from CMC Texpan; and pre-heaters, special emphasis is being placed on the topic of "Industry 4.0".

Reducing production costs, improving product quality and increasing plant output are the parameters that plant owners have to manage in order to maintain, or even enhance, the economic efficiency of their production plants.

Siempelkamp summarises these customer requirements under the mission statement "Cut your cost!" and says it develops machines and components to help wood based panel producers reach this goal. At WMF Beijing, Siempelkamp is presenting both

new concepts and market-ready systems to the panel industry, making it possible to get the most out of plants for the production of wood based panels.
